ROUTE OTP

Secure your space

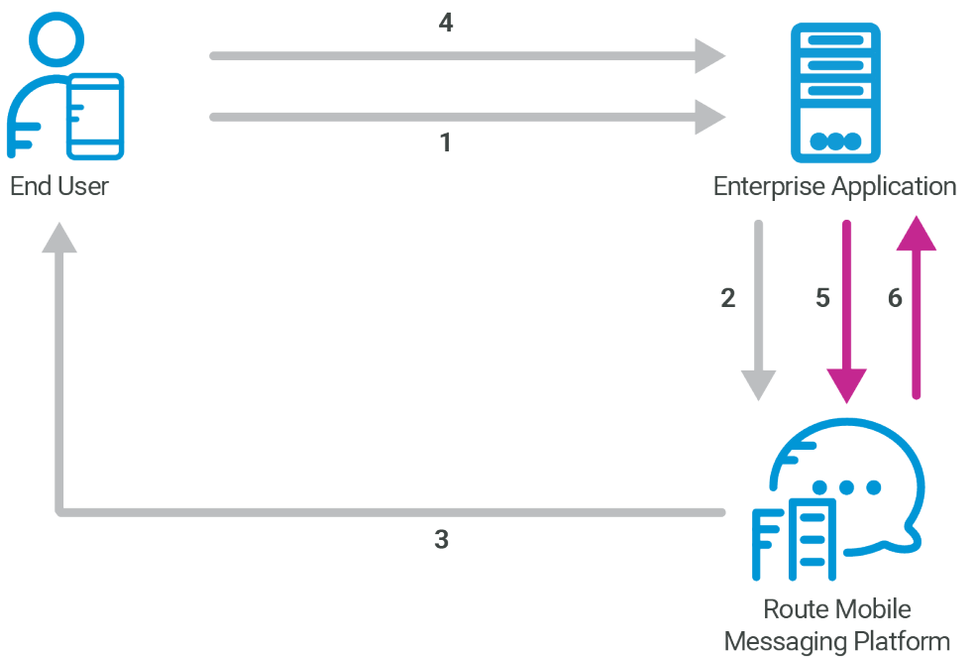
Route OTP makes it possible to secure your transaction with easy-to-generate One Time Passwords

Login access has shifted from Username- Password to Username-OTP model. At the time of registration, users are asked to provide their mobile numbers and login access is authenticated by sending an OTP to the registered mobile number. Any fraudulent access is ceased since only registered users are provided with the OTP on their registered mobile numbers.

This entire process of generation and authentication of OTPs can be directed by Route Mobile securely without the help of any additional resources at the client's end. The only effort required is to use the interface provided by RML for OTP generation, SMS delivery, and verification with the service provider.

HOW DOES IT WORK?

1. User requests access to Client interface.
2. Client sends the code generation request to RML by feeding mobile number.
3. RML will generate a random code & send it to the customer via SMS.
4. Customer enters the code in Client's user interface.
5. Client will send the code back to RML for verification.
6. RML will verify & send the result back to the client.



BENEFIT

- No need to create separate OTP platform
- Faster delivery of OTP
- Detailed analysis on OTPs generated, authenticated and failed
- Complete control at customer end, as the application will help manage when to generate OTP and whom to authenticate
